A PARTIAL LISTING OF WITWATERSRAND BOREHOLES

INTRODUCTION

The first diamond-drilled, cored borehole, undertaken to acquire subsurface information on the depth, disposition, and degree of mineralization of Witwatersrand conglomerates, was commenced in December, 1889, and completed in March, 1890. It was sited on what became the Village Main Reef Gold Mine, and it intersected the Main Reef Leader at a depth of 177 metres. Other boreholes followed, and, by 1901, a record depth of 1471 metres was reached in the Turf Club East hole. In the 101 years that have elapsed since the Village Main Reef pioneering achievement, it is estimated that of the order of 3000 boreholes have been drilled in the course of exploration within and around the Witwatersrand Basin. A very large proportion of this number is located within what subsequently became mining-lease areas in which the borehole information was supplanted by a great volume of detailed data obtained from development and mining operations.

The goal of this compilation has been to prepare a listing of boreholes located outside the boundaries of the current mining-lease areas and to provide a very generalized log of the major stratigraphic formations intersected. It purports to be no more than a partial, incomplete record. A total of 1745 boreholes is covered by the listing. A very speculative estimate suggests that another 400 - 600 holes have been put down during the many programmes of Witwatersrand exploration. Information pertaining to the older of these additional boreholes has been "lost" from government records and has "disappeared" with the files of defunct exploration and mining companies. The results of more-recent drilling, dating back to the early 1970's, in many instances, remain undisclosed in the confidential data-banks of the major mining groups that presently dominate the Witwatersrand mining scene. The paucity of available information on what has been learned from the extensive exploration drilling is further underlined by the fact that logs have been located for only half of the 1745 boreholes listed.

SOURCES OF INFORMATION

The present listing had its origins in a 1951 publication of The Technical Map Service of Johannesburg. A Mr. Carmichael, head of this private company, prepared and issued, for limited distribution, an inventory of 1088 boreholes which had been completed, up to the end of 1950, in and around the Witwatersrand Basin. No less than 1033 of these holes had geological logs available. The ever-increasing reluctance on the part of exploration companies to disclose the results of their drilling is apparent in the fact that, in the 1950 listing, 95 per cent of the boreholes could be employed usefully in unravelling the subsurface geology, whereas, in the present listing, the figure has dropped markedly to 50 per cent. A substantial proportion of the holes described by The Technical Map Service (1951) subsequently were included in mining-lease areas. Carmichael (The Technical Map Service, 1955 and 1961) brought out two further compilations, the earlier one relating to the Klerksdorp Goldfield and the later one to the Welkom Goldfield. No geological logs were disclosed for any of the holes, only the thicknesses and values of reef-intersections being shown against the boreholes in both fields. For the Klerksdorp area,

267 boreholes were listed and, for the Welkom area, 321 boreholes. By far the greater majority of the holes in both goldfields came to be embraced by mining-lease areas. Because of their ultimate location in mining-leases, a very sizeable percentage of the boreholes mentioned in the three semi-private publications of The Technical Map Service is not included in the present compilation.

In 1961, R. Borchers published his benchmark paper and two maps on the extent, shape, and subsurface nature of the Witwatersrand Basin. This highly-significant contribution to a better understanding of the depository, contained, in one version of the paper, an annexure listing 319 boreholes, outside the mining-lease areas, which had been employed in the draughting of "Diagram No. 2 : Distribution of the Witwatersrand System", which carries the date 1960. The paper with the annexure appears in the proceedings of the Seventh Commonwealth Mining and Metallurgical Congress held in April, 1961, in Johannesburg. The same paper, as published by the Geological Society of South Africa, does not include the annexure.

In the early 1980's, the Geological Survey of South Africa started releasing, on open file, generalized logs, lodged by law, of boreholes drilled by a large number of mining and exploration companies. A period of at least 15 years had to have elapsed since the completion of the hole before the Geological Survey could be granted permission by the company concerned to place the log on open file. All releases up to February, 1987, have been incorporated into the present compilation. The practice was discontinued on that date by the Geological Survey, and it then became apparent that nothing further was to be gained by delaying the finalization of the present listing.

Since the 1960's, the Economic Geology Research Unit has kept its own records of press and other releases by mining companies, relating to exploration drilling in the Witwatersrand Basin. This operation was terminated at the end of 1988. Thus, the present compilation will not be found to contain information which became available after 1987-88.

In mid-1985, the first draft of the present listing was sent to the six major mining groups, requesting their scrutiny of the maps and tabulations, the correction of errors and omissions, and the addition of whatever further drilling information they were willing to release. Only a partial response was obtained, but the information obtained from two of the groups helped improve and expand the data-base. The first, provisional listing, supplemented by the responses of the mining groups, was employed by Pretorius, Brink, and Fouché (1986) in the compilation of their map entitled "The Witwatersrand Basin : Surface and Subsurface Geology and Structure", which was published by the Geological Society of South Africa, to commemorate the centenary of the discovery of the Witwatersrand goldfields. No listing of the boreholes utilized accompanied the map.

PROCEDURE OF COMPILATION

The pioneering listing in 1951 of The Technical Map Service grouped all boreholes according to the magisterial district in which the farm was located on which the hole was sited. The initial compilation of the present listing followed the same procedure, the base-maps depicting the boundaries of magisterial districts and of farms being the standard, government-issued, 1 : 250 000 topocadastral sheets, each of which covers two degrees of longitude by one degree of latitude.

In addition to the district, each borehole was identified, in the various records used, by a specific number, the name of the farm on which it was sited, and by the company which had drilled the hole. All the holes carried the names of the district and the farm, but, in a relatively small percentage of instances, the original number and/or the name of the company could not be traced. Certain boreholes, but only a minor proportion of the total of 1745 listed, also had their geographic coordinates and collar-elevations recorded. Because by far the greater majority of the drilled sites did not show such information, it was decided not to include elevations and coordinates in the present listing.

A positive suggestion that was made by both the mining groups which responded to the request for examination of the first draft was that the identification by district be replaced by identification by topocadastral sheet. The boundaries of magisterial districts do not remain constant and are often shifted in the course of delimitations prior to general elections. In many instances, portions of the same district are located on two different topocadastral sheets.

Following these suggestions, the first draft was transcribed into a new format. Primary identification, in this version of the listing, is by topocadastral sheet and secondary listing by $\frac{1}{2}'' \times \frac{1}{2}''$ quadrants, there being eight such quadrants on each $2^\circ \times 1^\circ$ sheet. Drilling sites in, and immediately surrounding, the Witwatersrand Basin have been found to occur on the ten topocadastral sheets that are identified on Figure 1 and that span a region between longitudes 24°E and 30°E and between latitudes 25°S and 29°S . This disposition and style of labelling of each quadrant on a sheet are depicted in Figure 2. All boreholes were re-numbered, consecutive numbering being discreet for each sheet.

From the first listing, an analysis - entitled "Location of Boreholes According to Magisterial Districts in the Transvaal and Orange Free State" - was prepared, indicating the topocadastral sheet/sheets on which each district is to be found, the number of boreholes located in the district, and the number and percentage of these for which generalized geological logs have been recovered. From the present (second) listing, two analyses - "Location of Boreholes According to 1 : 250 000 Topocadastral Sheets" and "1 : 250 000 Topocadastral Sheet Summary" - were undertaken, detailing the number of boreholes drilled in each quadrant of each sheet and the portions of the different magisterial districts located in each quadrant. To compact the spread of the listing, abbreviations have been used for company names and geological formations. The abbreviations for the former are set out in "Key to Companies Which Drilled the Boreholes" and for the latter in "Key to Abbreviations Used for Borehole Data", the abbreviations applying to stratigraphic, lithologic, reef, and miscellaneous aspects of the generalized logs.

The present listing consists of the following information for each borehole: (i) topocadastral sheet, (ii) quadrant on the sheet, (iii) number on the sheet, (iv) original number, (v) name and number of farm, (vi) name of company, and (vii) generalized geological log. Items (i), (ii), and (iii) are indicated for every hole, but, in half the instances, information relating to one or more of Items (iv), (v), (vi), and (vii) has not been found to be available in the drilling records located. Information on the date of drilling was entered in the records of only a limited number of boreholes, and it was not possible to incorporate dates systematically and consistently in the data included in the present listing. The depths below surface shown in the logs have been rounded off to the nearest metre.

SHORTCOMINGS AND LIMITATIONS

The reliability of the present compilation can reflect only the accuracy of the original records, no matter of what nature, that were available to the present undertaking. The quality of a fair proportion of these records leaves much to be desired. Consequently, it has to be accepted that omissions, inaccuracies, and errors can be anticipated to be present in a limited number of instances. Only the mining and exploration companies which drilled the boreholes would be in a position to remedy these deficiencies in this partial listing of holes which have been completed during the course of 100 years of prospecting in and around the Witwatersrand Basin.

In quite a few instances, information from different sources indicates different positions for the same borehole on a particular farm. The same borehole sometimes carries two different original numbers, and, in other cases, the same-numbered borehole has a different geological log recorded against it. It is virtually impossible to rectify these contradictions without access to the confidential files of the mining companies. Consequently, there are a small number of duplications of borehole numbers and logs in the listing. The logs of holes drilled well away from the various mining-lease areas have some uncertainty attached to them with respect to the correlation of the strata intersected. In some instances, the formations have been recorded as "uncorrelated", while in others a tentative, and therefore potentially dubious, correlation has been made. Caution has to be exercised in a small minority of cases, in accepting the validity of the stratigraphic classification indicated in the geological log.

KEY TO ABBREVIATIONS USED FOR BOREHOLE DATA

STRATIGRAPHIC

| | |
|------------------|--|
| Black Rf. | Black Reef Formation of the Transvaal Supergroup |
| Booysens Shale | Booysens Shale Formation of the Johannesburg Sub-Group of the Central Rand Group |
| Bushveld | Bushveld Igneous Complex |
| CR | Central Rand Group of the Witwatersrand Supergroup |
| CR (Mondeor) | Mondeor Formation of the Turffontein Sub-Group of the Central Rand Group |
| CR (Turffontein) | Turffontein Sub-Group of the Central Rand Group |
| Cont Bd | Contorted Bed of the Hospital Hill Sub-Group of the West Rand Group |
| DR | Dominion Group of the Witwatersrand Supergroup |
| Green Bar | Green Bar of the Johannesburg Sub-Group of the Central Rand Group |
| Hosp Hill | Hospital Hill Sub-Group of the West Rand Group |
| K | Karoo Supergroup |
| Kraaipan | Kraaipan Group of the Archean basement |
| T | Transvaal Supergroup |
| V | Ventersdorp Supergroup |
| WR | West Rand Group of the Witwatersrand Supergroup |

LITHOLOGIC

| | |
|------------------|-------------------|
| amyg lava | amygdaloidal lava |
| ark | arkose |
| aurif | auriferous |
| congl | conglomerate |
| cont | contorted |
| dolm | dolomite |
| gabbro | gabbro |
| gn | gneiss |
| gran | granite |
| grnstn | greenstone |
| grit | grit |
| intr | intrusive |
| lava | lava |
| metased | metasediment |
| qzt | quartzite |
| schist | schist |
| sed | sediment |
| sh | shale |
| tuff | tuffaceous |
| volcanic breccia | volcanic breccia |

WITWATERSRAND REEFS

| | |
|----------|----------------|
| A Rf | A Reef |
| AM Rf | Ada May Reef |
| 'B' Rf | B Reef |
| B Rf | Basal Reef |
